Handling Extraneous Variables

Extraneous variables: variables that could influence the response but which are not of practical interest Ignoring the extraneous variables in the experiment planning can cloud the perception of the effect of treatment variables that are of interest - need to assign treatments to experimental units in a way that remove the effect of extraneous variables

The Design of Statistical Studies (Ch 1-2)

Randomization

Randomization without blocks

Randomization with Blo

Two ways to handle extraneous variables:

- blocking: include the variables as an experimental factor, with the purpose of creating relatively homogeneous environments in which to look for the effect of the treatment variables effect of the blocking variable is removed within each block
- randomization: not all extraneous variables can be supervised using a randomizing device or table of random digits in choice of experimental protocal for each experimental unit hope is to balance out the effect of extraneous variables

Randomization with

Completely Randomized Design

► Completely Randomized Design

- an experimental design with one treatment variable and no blocking variables.
- ► Sample units are randomly assigned to treatment levels.
- Example: metallurgy
 - ► Test the effect of different additives on the corrosion rate of steel.
 - ► Sample: 12 pieces of raw iron
 - ► Treatment: additive (A, B, or C).
 - ➤ Treatment groups: A (units 1-4), B (units 5-8), and C (units 9-12)

| Sample unit | Additive | Sample unit | Additive |
|-------------|----------|-------------|----------|
| 1 | A | 7 | В |
| 2 | A | 8 | В |
| 3 | Α | 9 | С |
| 4 | Α | 10 | С |
| 5 | В | 11 | C |
| 6 | В | 12 | C |

Factorial Design

► Factorial Design

- an experimental design with multiple treatment variable (as factors) and no blocking variables.
- ► Each sample unit is randomly assigned to a combination of treatment levels.
- ightharpoonup Example: metallurgy: a 3 imes 2 factorial version
 - ► Treatment 1: additive (A, B, or C).
 - ► Treatment 2: temperature (high or low)
 - ➤ Treatment groups: A high (units 1-2), A low (units 3-4), B high (units 5-6), B low (units 7-8), C high (units 9-10), C low (units 11-12),

| - (| Unit | Additive | Temp | Unit | Additive | Temp |
|-----|------|----------|------|------|----------|------|
| | 1 | Α | high | 7 | В | low |
| | 2 | Α | high | 8 | В | low |
| | 3 | Α | low | 9 | C | high |
| | 4 | Α | low | 10 | C | high |
| | 5 | В | high | 11 | C | low |
| | 6 | В | high | 12 | C | low |

Metallurgy example: a 2³ factorial version

- ► Sample: 16 pieces of iron.
- ▶ Treatments:
 - ► Treatment 1: additive (A or B)
 - ► Treatment 2: temperature (high or low)
 - ► Treatment 3: smelting time (long or short)
- ► Treatment groups: A high long (units 1-2) A high short (units 3-4), ..., B low short (units 11-12).

| Unit | Add | Temp | Smelt | Unit | Add | Temp | Smelt |
|------|-----|------|-------|------|-----|------|-------|
| 1 | Α | high | long | 9 | В | high | long |
| 2 | Α | high | long | 10 | В | high | long |
| 3 | Α | high | short | 11 | В | high | short |
| 4 | Α | high | short | 12 | В | high | short |
| 5 | Α | low | long | 13 | В | low | long |
| 6 | Α | low | long | 14 | В | low | long |
| 7 | Α | low | short | 15 | В | low | short |
| 8 | A | low | short | 16 | В | low | short |

Completely Randomized

Factorial Design

Simple Random

Randomization

Randomized Complete Block Design

► Randomized Complete Block Design

- an experimental design with one or more treatment variable and at least one blocking variable.
- Within each block separately, sample units are assigned to treatment groups
- Example: metallurgy
 - Treatment: additive (A, B, or C).
 - Blocking variable: pig iron supplier (Amset or Miller and Co.)

| Unit | Supplier | Add | Unit | Supplier | Add |
|------|----------|-----|------|----------|-----|
| 1 | Amset | Α | 7 | Miller | Α |
| 2 | Amset | Α | 8 | Miller | Α |
| 3 | Amset | В | 9 | Miller | В |
| 4 | Amset | В | 10 | Miller | В |
| 5 | Amset | C | 11 | Miller | C |
| 6 | Amset | С | 12 | Miller | С |

Simple Random Sampling

- ➤ **Simple Random Sampling**: drawing a sample of *n* units from a finite population of *N* units such that every possible *n*-sized subset of the population has an equal chance of being selected.
- Use either a computerized random number generator or a table of random digits.

Random Digits

Simple Random

Sampling

Randomization

Steps of Simple Random Sampling

- 1. Let M be the number of digits in the number N-1, where N is the population size. (If N=1000 then M=3 digits.)
- 2. Give each member of the population an M-digit index, i (say, $i = 000, 001, \dots, 999$)
- 3. Move through the table of random digits from left to right, top to bottom, selecting population members for the sample when you encounter their indices (ignoring indices that have already been chosen) until you have selected *n* units for the sample.

Randomization without blocks

- Randomization: assigning sample units to treatment groups in an experiment such that every set of assignments is equally likely.
- Steps to randomize n sample units to t treatment groups, each of size s (n = ts):
 - Use the table of random digits to select s units for treatment group 1 from the experimental sample of n units
 - 2. Continuing from your last spot in the table, select s units for treatment group 2 from the remaining n-s units in the experimental sample.
 - 3. Continue this process until you have selected t-1 treatment groups. The remaining units will belong to the last treatment group.

Your turn: metallurgy

Randomize our experimental sample of 12 units of pig iron to thee treatment groups (for additives A, B, and C).

Simple Random Sampling

Randomization

Randomization without blocks Randomization with Block

For randomization in factorial studies, know your treatment groups.

- Example: metallurgy: a 3 × 2 factorial version
 - ightharpoonup Sample: n=12 units
 - ► Treatment 1: additive (A, B, or C).
 - ► Treatment 2: temperature (high or low).
- How many treatment groups do we have?
- How many units of the experimental sample should I randomize to each treatment group?

The Design of Statistical Studies (Ch 1-2)

Yifan 7hu

Handling Variables

Experimental Designs

Randomization

Know you treatment groups: answers

- 1. $3 \times 2 = 6$ treatment groups.
- 2. Each treatment group has 12/6 = 2 units of pig iron.

The Design of Statistical Studies (Ch 1-2)

Yifan Zhu

Handling Extraneous Variables

Common Experimental Designs

Completely Randomized Design

actorial Design

Block Design

Simple Random Sampling

Randomization

Randomization without blocks

Randomization with blocks

Randomize units to treatments within each block.

| Unit | Supplier | Add | Unit | Supplier | Add |
|------|----------|-----|------|----------|-----|
| 1 | Amset | Α | 7 | Miller | Α |
| 2 | Amset | Α | 8 | Miller | Α |
| 3 | Amset | В | 9 | Miller | В |
| 4 | Amset | В | 10 | Miller | В |
| 5 | Amset | C | 11 | Miller | C |
| 6 | Amset | C | 12 | Miller | C |

- ► For the metallurgy block design:
 - Randomize all *Amset units* to treatments A, B, and C
 - ► Then, picking up where you left off in the table of random digits, randomize all *Miller units* to treatments A, B, and C.
